                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR41682-85 are encoded by the expression vector, pAH4602. This vector contains open reading frames encoding the heavy chain variable region (WH) of the antibody 128.1, an ampicialin resistance gene and a histidine (histidinol) selection marker.

Transcription of the VH gene is from the VH promoter of the murine 27.44 gene. The vector also includes a heavy chain immunoglobulin enhancer and the human gammal constant region (CH). The VH region of 128.1 was colieved by polymerase chain reaction and cloned into plasmid pAH4274.

This was achieved by digesting the plasmid and the product with EcoRV and Nhel. The VH gene was inserted in-frame with the human gammal CH region CH at the 3' end of the VH-J region by means of a Nhel site. 128.1 is an ceptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuro-pharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent charkingons and Alzheimers disease. It may also be used for diagnostic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                64

                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ð
                                                                                                                                                                                  which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an osteopathic, cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen, gastrointestinal-Gen, grantolitory, endocrine-Gen, gastrointestinal-Gen, grantolitory, endocrine-Gen, gastrointestinal-Gen, grantolitory, endocrine-Gen, grantolitory memoralists, memoratory in enroleptic, ophthalmological, mephrotropic or respiratory-Gen activity acting as a tumour necrosis factor (TNF)-modulator or cytokine-agonist. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CH1 deleted mimetibody, such as a bone or joint, cardiovascular, dental or oral, dermatological, ear, nose or throat, candorine, metabolic, gastrointestinal, gynaecological, hepatic, obstetric, haematologic, immunological, allergic, infectious, musculoskeletal, oncological, neurological, nutritional, ophthalmologic, pediatric, psychiatric, renal or pulmonary disorders. The present cequence is that of a CH2 peptide which may be used during the creation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                        Immunoglobulin E variants as peptide antagonists useful for raising and screening anti-immunoglobulin E (IgE) antibodies, in the isolation and purification of FcepsilonRI receptor and in the treatment of allergic
                                                                                                                                                                                                                                                                         or more of the FoepsilonRI receptor-binding determinant sites of buman 1gE. The antagonists include 1gE variants comprising an immunoglobulin template and binding determinant sequences (bds) CDD6a, BFbds and the sequence shown in AAY42581. The CDbds (CD loop binding determinant sequences) are selected from the sequences shown in AAY42567-Y42577 and the BFbds (BF loop binding determinant sequence) are selected from sequences shown in AAY4258-Y42580. The variants are useful in raising and screening anti-1gE antibodies, in the isolation and purification of PcepsilonRI receptor and in the treatment and prophylaxis of allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human immunoglobulin G1 (IgG1) Fc region second constant (CH2) domain.

The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. A recombinant human Ig molecule capable of binding to an FC gamma receptor (FogammaR) of an antigen presenting cell (APC) was used to illustrate the invention. The recombinant human Ig molecule comprises a CH3 region (ADL90102), a CH2 region (ADL90103), a hinge region (ADL90104) and a flanking peptide (ADL90105).

                                                                                            The invention relates to a modified immunoglobulin (IgG1) which comprises in IgG constant domain having at least one amino acid modification. The immunoglobulins are used in the treatment or prevention of a disease or disorder by passive immunotherapy for vaccinating a subject and for in vivo diagnosis of a subject. The disease and disorders include a gamma globulinaemia, hypogammaglobulinaemia, autoimmune diseases, graft-versushost, lymphoid malignancies and passive immunotherapies and also for the treatment of various systemic infections. The present sequence is human immunoglobulin GI (IgG1) Fc region second constant (CH2) domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a new composition comprises a variant of a parent polypeptide having at least a portion of a Fc region. The variant mediates antibody-dependent cell-mediated cytotoxicity (ADCC) in the presence of effector cells more effectively than the parent polypeptide and comprises at least one amino acid modification at position 280 in the Fc region. The composition is useful in treating diseases e.g., autoimmune diseases. The present sequence represents a CH2 region
                                                                                                                                                                                                                                                                                                                                                                                                                                       63

-!- MISCELLANBOUS: The sequence shown is the Kern-/Oz-/Mcg- chain found in proteins 8H, X, and NIG-64. The Kern protein has the reart marker, the NEWM protein has the Oz+ marker, the Mcg protein has the Kern+ marker, and the Mcg+ marker.

-!- MISCELLANBOUS: Six tandem lambda-type genes were identified and the 3 most 5' were sequenced. These correspond to the Mcg sequence (lambda-1), the Kern-/Oz- sequence (lambda-2) and the Kern-/Oz+ sequence (lambda-3).

-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           X-RAY CRYSTALLOGRAPHY (2.3 ANGSTROMS) OF MCG.

"A genomic gene encoding the b5 rabbit immunoglobulin kappa constant region: implications for latent allotype phenomenon.",
proc. Natl. Acad. Sci. U.S.A. 81:1789-1793 (1984).

-!- MISCELLANBOUS: The cDNA from which this sequence was derived contains a terminator codon within the V-region coding region. The origin of this codon and of the differences between this and other sequenced b5 C regions are unclear. The cDNA clone was made using mRNA from trypanosome-infected b5-homozygous rabbits.
-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          41; Indels 12; Gaps

Patent No. 6015555

GENERAL INFORMATION:

APPLICANT: Friden, Phillip M.

TITLE OF INVENTION: ANTIBODY-NEUROPHARMACEUTICAL OR DIAGNOSTIC AGENT
TITLE OF INVENTION: ANTIBODY-NEUROPHARMACEUTICAL OR DIAGNOSTIC AGENT
TITLE OF INVENTION: CONJUGATES
NUMBER OF SEQUENCES: 46
CORRESPONDENCE ADDRESS:
ADDRESSE: Hamilton, Brook, Smith & Reynolds, P.C.
STREET: Two Militia Drive
CITY: Lexington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COMPUTER LEADABLE FORM:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4 VAGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFNWYVDGVEVHNAKTKPREE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 LGGPSVPLFPPKRVDTLMISRTPEVTCVVVDVSQEDPEVQENWYVDGVEVHNAKTKPREE
                                                                                                                                                                                                                                                                     Sequence 1. Application US/08070116A

Patent No. 5885573

GENERAL INFORMATION:

APPLICANT: 21vin, Robert A.

APPLICANT: Joulife, Linda K.

APPLICANT: Bluestone, Jeffrey A.

TITLE OF INVENTION: Methods and Materials For Modulation

TITLE OF INVENTION: Of the Immuno-suppressive Activity and

TITLE OF INVENTION: Toxicity of Monoclonal Antibodies

NUMBER OF SEQUENCES: 18

CORRESPONDENCE ADDRESS:

ADDRESSER: AARNOId, White & Durkee

STREET: P.O. Box 4433

CITY: Houston
                                                                                                                           61 REEQFNSTFRVVSVLTVVHQDWLNGKEYKCKVSNKGLPAPIEKTISKTK 109
                                                                                       61 REEQFINSTFRVVSVLTVVHQDWLNGKEYKCKVSNKGLPSSIEKTISKTK 109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 4, Application US/08557050
Patent No. 6491916
EDBERAL INFORMATION:
APPLICANT: Bluestone, Jeffrey A.
APPLICANT: Zivin, Robert A.
APPLICANT: Jobliffe, Linda K.
APPLICANT: MODULATION OF INVENTION: METHODS AND MATERIALS FOR MODULATION OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match 92.4%; Score 536; DB 2; Length 109; Best Local Similarity 94.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 21, Application US/08444644

Patent No. 601555

GENERAL INFORMATION: Phillip M.

TITLE OF INVENTION: TRANSFERRIN RECEPTOR SPECIFIC

TITLE OF INVENTION: ANTIBODY-NEUROPHARMACEUTICAL OR DIAGNOSTIC AGENT

TITLE OF INVENTION: CONUCATES

NUMBER OF SEQUENCES: 46

CORRESPONDENCE ADDRESS:

ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C.

STREET: Two Militia Drive

CITY: Lexington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin properties.

Claim 12; Fig 17; 81pp; English.

and This sequence represents the mutated CH2 molecule Gldeltaac, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without triggering complement dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; a (b) an effector domain that is homologous to all or part of a constant

```
domain of a human immunoglobulin G (IgG) heavy chain. The binding molecule is used to bind a target molecule (especially FogammaRID causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule is useful for the tradement of graft-venolection, autoimmunity (e.g. an antibody, to the target cattoimmune thrombocytopaenia and arthritis, autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. cattoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. cattoimmune thrombocytopaenia, asthma and allergy), chronic or acute inflammatory diseases (e.g. Crohn's, HDN chronic or acute inflammatory diseases (e.g. Crohn's, HDN coronary artery occlusion). The binding molecules do not activate complement or trigger cytotoxic activities through FogammaR and desirable thoman amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent with being able to cross the human placenta through interaction with FCRn consistent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Immunoglobulic-derived binding molecules that do not activate complement or trigger cytotoxic activities and maintaining desirable immunoglobulin

```
This sequence represents the mutated CH2 molecule Gldeltaab, and is a binding molecule of the invention. The recombinant binding molecule is capable of binding a target molecule without tringgering complement capable of binding domain capable of binding a target molecule; and dependent lysis, or the cell-mediated destruction of the target comprises: (a) a binding domain capable of binding a target molecule; and (CD) an effector domain that is homologous to all or part of a constant comman in mimunoglobulin G (IgG) heavy chain. The binding causing inhibition of B cell activation, mast cell degranulation or phagocytosis). The binding molecule can be used to prevent or inhibit the binding molecule can be used to prevent or inhibit the binding molecule is useful for the treatment of graft-vs. The binding molecule is useful for the treatment of graft-vs. Compaction, autoimmunity (e.g. vasculitis, autoimmune harmonlytic anaemia, autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. autoimmune thrombocytopaenia and arthritis), alloimmunity (e.g. chronic or acute inflammatory diseases (e.g. Crohn's, HDN contarl inflammatory diseases (e.g. Crohn's, HDN compactions and arthritis and activate complement or tringger cytotoxic activities through FogammaR and desirable complement or tringger cytotoxic activities through FogammaR and desirable thuman amino acids, and are therefore likely to have reduced immunogenicity. Further, they still bind Protein A, which is consistent immunogenically consistent through interaction with FCRn consistent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

The invention relates to a recombinant human erythropoietin (Hubbo)-L-vFC fusion protein comprising HubFO, a peptide linker, and a human C fragment crystallisation reegion) variant. Also included is a carbohydrate-derived cell line producing the human crospension by the cases of 10 midrogramme per million cells in a 24-hour period. The HubFO L-vFC fusion protein cited above in its growth medium in crospaneme per million cells in a 24-hour period. The HubFO L-vFC fusion protein exhibits an enhanced in vitro biological activity of at least 2-fold relative to that of recombinant HubFO on a molar of at least 2-fold relative to that of recombinant HubFO on a molar contains amino acid mutations to attenuate effector functions. The lugger contains amino acid mutations to attenuate effector functions. The human comprises a hinge, CH2 and CH3 domains of human igG2 with pro331Ser mutations, human igG4 with Ser228Pro and Leu235Ala mutations, or human igG1 with Leu234Val, Leu235Ala and Pro331Ser mutations, or human igG1 with chronic anaemia caused by renal failure, cancer crecombinant human erythropoietin-L-vFc fusion protein in frequent injections to myelodysplastic syndrome. The increased activity and prosoned prosoned presence of the human erythropoietin-L-vFc fusion protein in the serum, as compared to prior art, leads to lower dosages and less frequent injections result in better patient compaliance and quality, and less frequent injections result in better patient compaliance and quality of life. The present sequence represents the fusion protein HuEPO-L-vFcgammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant human erythropoietin-L-vFc fusion proteins, useful for treating patients with chronic anemia caused by renal failure, cancer chemotherapy, rheumatoid arthritis, or azathioprine treatment for HIV

2004-634851/61. N-PSDB; ADR48987 New recombinant HuEPO-L-vPc fusion protein comprises human erythropoietin (HuEPO), a peptide linker, and a human IgG Pc variant, useful for treating chronic anemia due to renal diseases, cancer chemotherapy, or rheumatoid arthritis.

Claim 5; SEQ ID NO 22; 31pp; English.

N-PSDB; ADM33379

```
protein is useful for treating patients with chronic anemia due to renal diseases, cancer chemotherapy, rheumatoid arthritis, AZT treatment for HIV infection, or myelodysplastic syndrome. It is also useful in the treatment of renal failure. A fusion protein was assembled from several DNA segments. To obtain the gene encoding the leader peptide and mature protein of human erythropotetin (EPO), cDNA library of human fetal liver or kidney was used as the template in polymerase chain reaction (PCR). For the convenience of cloning, SEQ ID NO. 1 which incorporates a restriction enzyme cleavage site is used as the S. Oligonucleotide primer. The 3' primer (SEQ ID NO. 2) eliminates the EPO termination codon and incorporates a BamHI site. The resulting DNA fragments of approximately GOD by were inserted into a holding vector such as pUCI9 at the HindIII and BamHI sites to give the pEPO plasmid. The sequence of the human EPO gene was confirmed by DNA sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 435 AA;

```
The invention describes a recombinant human granulocyte colony-
stimulating factor (NG-CSF)-L-vFc fusion protein comprising NG-CSF, a
peptide linker, and a human immunoglobulin G (IGG) Fc variant. Also
described are: a CHO-derived cell line producing the above NG-CSF-L-vFc
fusion protein in its growth medium in excess of 10 kmgr;g per million
cells in a 24-hour period; and making the recombinant fusion protein
cited above, comprising generating a CHO-derived cell line cited above,
growing the cell line under conditions the recombinant fusion protein is
expressed in its growth medium, and purifying the expressed protein. The
recombinant fusion protein is useful in treating a variety of conditions
associated with an impaired immune or haematopoietic system, including
cancer chemotherapy. Jeukaemias, anaemias, AlDS, bone marrow
cransplantation, and chronic neutropenias. This is the amino acid
sequence of human GCSF-L-fragment of crystallisation gamma 1 variant
                                                                               vFc fusion protein for treating immune or hematopoietic system disorders comprises hG-CSF, a flexible peptide linker, and a human immunoglobulin
                                                   New recombinant human granulocyte colony-stimulating factor (hG-CSF)-L-

Human FGF-RI Extracellular domain-Ig Fc fusion protein 6.
      04-DEC-2000 (first entry)
    New antibodies which bind and neutralise interferon-gamma (IFN gamma) can be used as a medicant, for preventing or treating septic shock, cachexia, immune diseases including multiple solerosis and Crohn's disease and skin disorders including bullous, inflammatory and neoplastic dermatoses. The disorders including bullous, inflammatory and neoplastic dermatoses. The antibody is selected from a single chain antibody (scFv), a chimeric antibody of diabody comprising the humanised variable domain of the monoclonal mouse anti-IFN gamma antibody bDB10; a multivalent antibody; (scFv) and sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion CDB10; a multivalent antibody; (scFv) as sample. Two fusion constant domain in which the Clq-complement binding site comparised CDB10 heavy chain constant domain in which the Clq-complement binding site (and the subsequently amplified using two primers (AAX08589, AAX08589) to generate PCR-VI fragment. The two primers (AAX08599, AAX08599) to generate PCR-VI fragment. The two fragments had a base pair overlap and were muplified with two primers (AAX08599, AAX08599, AAX08599, CC give pGBM-T to give pGBM-T-Wh using two primers (AAX08599, AAX08599, AAX08599, AAX08599, AAX08599, AAX08599, AAX08599, AAX08599, AAX08500 and the resulting PCR-X fragment inserted into pGBM-T CC generate PCR-VII fragment and AAX08599, AAX08599, AAX08599, AAX08500 and the resulting PCR-X fragment inserted into pGBM-T complement compared the overlapped and fused using primers (AAX08599, AAX08599, AAX08599, AAX08500 and the resulting PCR-X fragment inserted into pGBM-T compared the overlapped and fused using prompared into compared the
                                                                                                                                                                               New engineered antibodies which bind and neutralise interferon-gamma -
useful for prevention and treatment of septic shock, cachexia, immune
diseases and skin disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GEMHD9D10H. New polypeptide comprising a fibroblast growth factor receptor extracellular domain fused to a heterologous oligomerization domain for treating FGF-, angiogenesis-, or FGF receptor-mediated disorders.

Claim 14; Page 68-69; 70pp; English.

Novel fusion protein constructs comprise a fibroblast growth factor (FGF) receptor (FGF-R) extracellular domain (ECD) lacking the immunoglobulin (Ig) I segment fused to a heterologous oligomerization domain that comprises an immunoglobulin Fc region, HIV, CH2, CH3 or CH4 region, or light chain of an immunoglobulin molecule, or a peptide with a recinc ripper motif. The Ig1 segment is not necessary for binding of acidic FGF and basic FGF (BFGF). The Ig1 deletion further increases the acidic FGF and heparin, protects the core of the molecule from affinity for aFGF and heparin, protects the core of the molecule from proteclysis, and abrogates the heparin requirement for aFGF-R monomer proteins. The FGFR-IG FC fusion dimers are active as FGF-R monomer protein as competitors of bFGF binding to immobilized FGF-Rs. The fusion constructs are useful to treat FGF- angiogenesis. or FGF-Rs. The fusion constructs are useful to treat FGF-, angiogenesis. or FGF-Rs. Cectal, testis and cervical tumours), neovascularization (e.g. bladder, breast, lung, rectal, testis and cervical tumours), neovascularization (e.g. diabetic retinogathy, neovascular glaucoma, wound healing and corneal scarring) postangioplasty and postatherectomy restenosis)

                                                                                                                                                                                                                                                                                                                                                                   Novel fusion protein constructs comprise a fibroblast growth factor (FGF)
receptor (FGF-R) extracellular domain (ECD) lacking the immunoglobulin
(Ig) i segment fused to a heterologous oligomerization domain that
comprises an immunoglobulin Fc region, hinge region, CH1, CH2, CH3 or CH4
region, or light chain of an immunoglobulin molecule, or a peptide with a
clearine zipper motif. The Ig I segment is not necessary for binding of
acidic FGF and basic FGF (BFGF). The Ig I deletion further increases the
affinity for aFGF and heparin, protects the core of the molecule from
affinity for aFGF and heparin, protects the core of the molecule from
core fusion polypeptides are better FGF inhibitors than FGF-R monomer
proteins. The FGFR-IG Fc fusion dimers are active as FGF-R monomer
protein as competitors of BGFP binding to immobilized FGF-Rs.
Chusion constructs are useful to treat FGF-, angiogenesis-, or FGF-R.
Chaic molomer protein as tumourigenesis (e.g. bladder, breast, lung,
rectal, testis and cervical tumours), neovascularization (e.g. diabetic
retinopathy, neovascular glaucoma, wound healing and corneal scarring)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                 New polypeptide comprising a fibroblast growth factor receptor extracellular domain fused to a heterologous oligomerization domain for treating FGF-, angiogenesis-, or FGF receptor-mediated disorders.

The antibody is selected from a single chain antibody (scFv), a chimeric antibody or diabody comprising the humanised variable domain of the monoclonal mouse anti-IFN gamma antibody b9D10; a multivalent antibody; or a ruminant antibody. The antibodies are also useful for determining IFN gamma levels in a sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               interferon gamma; IFN; treatment; prevention; septic shock; cachexia; immune disease; multiple sclerosis; Crohn's disease; skin disorders; inflammation; neoplasia; dermatitis; monoclonal antibody; diabody; scFv;

```
the present invention tetaces to mover antiboures that specifically Ding to very late activation (VLA-1; betal containing integrins) antigens and methods of using these antibodies to treat immunological disorders. The antibodies are useful for preventing or treating VLA-1 conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal conditions (e.g. psoriasis, eczema, burns, dermatitis and abnormal conditions (e.g. psoriasis, respiratory distress syndrome, asthma, chronitis, tendonitis, pursitis, inspiratory distress syndrome, asthma, chronitis, tendonitis, bursitis, respiratory distress syndrome, asthma, continies, tendonitis, bursitis, prever migraine headaches, gastro-cintestial conditions (e.g. inflammatory bowel disease, Crohn's disease, conscitis and colorectal cancer), cascular diseases (e.g. inflammatory bowel disease, crohn's disease, rheumatic fever, osteoarthritis, osteomic diseases (e.g. type I diabetes, myasthenia gravis, rheumatoid arthritis, systemic lupus erythematosus and multiple sclerosis), renal callure, sarcoidosis, nephrotic syndrome, Behcet's syndrome, ginglitity, or immediate hypersensitivity), graft and transplant rejections, graft columnosis host disease, conjunctivitis, swelling occurring after injury, error myocardial ischaemia or endotoxin shock syndrome. The present sequence is human AQC2 heavy chain mutant protein, hsAQC2
                                                                                                                                                                                                 Human; very late activation antigen; VLA-1; betal containing integrin; immunological disorder; inflammatory disorder; skin related condition; psoriasis; eczema; burn; dermatitis; respiratory distress syndrome; fibrosis; allergic rhinitis; asthma; bronchitis; tendonitis; bursitis; fever; migraine headache; inflammatory bowel disease; Crohn's disease; irritable bowel syndrome; colitis; colorectal cancer; vascular disease; arberosclerosis; thyroiditis; aplastic anaemia; periarteritis nodosa; gastritis; Hodgkin's disease; rheumatic fever; autoimmune disease; osteoarthritis; type I diabetes; myasthenia gravis; rheumatoid arthritis; systemic lupus erythematosus; multiple solerosis; neptrotic syndrome; renal failure; sarcoidosis; Behcet's syndrome; gingivitis; polymyositis; hypersensitivity; graft rejection; transplant rejection; conjunctivitis; graft versus host disease; myocardial ischaemia; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New anti-VLA-1 antibodies are useful for preventing or treating VLA-1-mediated immunological or inflammatory disorders, e.g. psoriasis, eczema, burns, dermatitis, and abnormal proliferation of hair follicle cells or

The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumour necrosis factor-like protein (ZTNF)2 or ZTNF4; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating cutoimmune diseases (e.g. systemic lupus erythematosus, multiple solerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. glomerulonephritis), bronchitis, inflammation, graft crejection, anaemia and septic shock. The fusion proteins are also used in group therapy. The present sequence is human immunoglobulin gammal mutant protein. This sequence is used in the exemplification of the invention. Note: This sequence is not shown in the specification, however it is

(1) has cytostatic, immunosuppressive, desmatological, antiinflammatory, neuroprotective, antidiabetic, antiarthritic, antiasthmatic, nephrotropic and hypotensive activities, and can be used in gene therapy. (1) can be used for inhibiting, in a mammal, the activity of a ligand that binds Ztnfr12
                                                                                                                                                            9
                                                                                                                                                                                           94
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated human tumor necrosis factor receptor polypeptide, termed Ztnfr 12, useful for treating autoimmune disorders, emphysema, end stage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; Ztnfr12; tumour necrosis factor receptor; cytostatic; immunosuppressive; dermatological; antinflammatory; antidabetic; neuroprotective; antixheumatic; antiarthritic; antiasthmatic; nephrotropic; hypotensive; gene therapy; B lymphocyte; tumour; autoimmune disorder; systemic lupus erythematosus; myasthenia gravis; multiple sclerosis; insulin dependent diabetes mellitus; asthema; rheumatoid arthitis; bronchitis; emphysema; renal disease; lymphoma; glomerulonephritis; bronchitis; chronic lymphoid leukaemia; nephritis; pyelonephritis; enal neoplasm; multiple myeloma; amyloidosis; light chain neuropathy; hypertension; large vessel disease; graft-versus host disease; graft rejection; Crohn's disease.
constructed based on human immunoglobulin gammal protein (SEQ ID NO:6) sequence shown in column 92-93 (AAE35214)
                                                                                                                                                                            1 APPVAGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEVHNAKTK

lymphocytes, activated B lymphocytes or resting B lymphocytes, and for inhibiting the proliferation of tumour cells. [1] is useful for treating autoimmume disorders such as systemic lupus erythematosus, myasthemia gravis, multiple sclerosis, insulin dependent diabetes mellitus, asthma, rheumatoid arthritis, bronchitis, emphysema and end stage renal failure or renal disease such as glomerulonephritis, vasculitis, chronic lymphoid leukaemia, nephritis, and pyelonephritis, and for treating renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, or amyloidosis, hypertension, large vessel disease, graft-versus host clisease, graft rejection and Crohn's disease. [1] is useful for modulating the immune system, for regulating B cell responses and development, for modulating development of other cells, antibody communication. Human Ztnfr12 is located to chromosome 22q13.2. The present sequence represents a mutaced Fc protein designated Fc5, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
